

Extrapolate solved  
helical transform to  
resolve next residue

Solve for the **helical transform, T** (rotation matrix, **R** and translation vector, **t** that relates **HYP** ( $i-1$ ) and **GLY** ( $i$ ) atom positions, by superimposing & minimising RMSD errors.

Apply the solved **helical transform, T** (rotation, **R** and translation, **t** to the final residue **GLY** ( $i$ ) atom positions, and extrapolate to find transformed positions of **PRO** ( $i+1$ ).
